Market Opportunities for Colocation and Server Hosting Providers

www.itmarketintelligence.com
© Copyright 2010, all rights reserved.

This report shows an approach to estimating market size, in terms of number of companies or potential clients, based on an estimated number of servers. Market size data is included based on this estimating approach and U.S. Census Bureau data. This information should provide a useful introduction to the subject for the purpose of market identification, sizing, and planning activities for companies in the colocation and server hosting business.

The words “company” and “firm” are both used throughout to mean an individual company. The word “firm” is terminology used by the U.S. Census Bureau to identify an individual company or other type of organization like a university. The U.S. Census Bureau tracks the number of firms and also the number of establishments operated by those firms. This report is focused on the number of firms, not establishments, which is most commonly where IT responsibility is located.

Characterizing Colocation and Server Hosting Markets

Defining target markets for any product or service can easily turn into a complex model with dozens of primary and secondary markets. The market size estimation approach in this report is based on a relatively simplistic view of the market that many colocation and server hosting companies sell to. The three basic markets colocation and server hosting companies tend to focus on are:

- **By The Server** – This market segment includes companies that might want to host one to a handful of servers. This market is typically smaller companies tired of the hassle or expense of maintaining their own physical servers. Although these companies may have an IT staff, the selling target is typically executive level. The companies in this market will likely have ten or less servers.
- **By The Rack** – Perhaps a half-rack to five racks would make up this market. At this level the market would consist of medium size companies, or smaller companies with an IT intensive environment. Depending on the size of the IT environment, sales in this market could be to either executive level or IT management. The companies in this market will likely have eleven to fifty servers.
- **By The Cage or Suite** – This market is typically medium to large size IT environments. Generally five or more racks in terms of space, perhaps with some midrange or large server systems. As end-user/company owned data centers become obsolete, run out of space, or require disaster recovery and failover backup, colocation has become a popular option as opposed to building a new data center. The companies in this market will likely have over fifty servers.

These example market definitions are provided as a frame of reference. Characterizing your own business in a similar way will help you apply the more detailed market size data presented below. The number of servers for each of the above defined markets are a rough estimate based on an optimistic average of 10 servers per rack, which is not based on any specific industry data but rather an ACR estimate. Feel free to insert your own numbers.

An Approach to Sizing Colocation and Server Hosting Markets by Company Size

The biggest challenge to identifying IT markets is the lack of detailed IT size data available in the market. If you hope to identify potential clients that have 10 servers, for example, there are very limited data sources that offer this kind of detail. One option is to use substitute demographic characteristics based on an understanding of how various types of companies utilize information technology.

Number of servers, as a way of identifying markets, is of primary interest to many colocation and server hosting companies. On average, there are 20 deployed PCs per server. Hence, an organization with 100 PCs will have an average of five servers.

Warning: Number of deployed PCs or end-users is not the same as the number of employees. Some vertical markets like finance, legal, or engineering will have a very high ratio of PCs per employee. Other verticals will have a far lower ratio of PCs to total employees. Retail is the most prominent example of this phenomenon as there is only one PC for every 5.2 employees. Most retail companies have multiple shifts of employees that work part-time, and only a limited number of them use a computer.

Having established that there is an average of one server for every 20 PCs and that the number of end-users will vary by vertical market, the final step is to isolate vertical markets and apply the end-user ratio to number of employees for each. From that result, an estimated number of servers can be determined and the resulting market size reported.

This approach is an estimating technique based on industry averages, not an absolute way to define all companies in the market. There are many companies that will have fewer or more servers than the average based on choices of systems architecture and application domain requirements.

Table Data Description

Each of the data tables builds upon or is related to the previous tables. The flow can be a bit complex, so this summary is meant to assist in the interpretation and show the practical application of the data.

Table 1 simply shows the ratio of PCs to total employees. It is this statistical data that is the basis for calculating the number of PCs in use, which is then used to calculate the number of servers.

Table 2 uses the ratios from table 1 to calculate the number of PCs in use by industry, then from that data the number of servers in use by industry. The number of firms and employment data is from the U.S. Census Bureau. This table shows the relative size of each industry in terms of number of servers in use.

Table 3 uses the size ratio data from Table 1 to calculate the average number of servers, by industry, based on the employment size ranges that are then also used in Table 4. For example, firms with 100 to 299 employees in healthcare are likely to have 2 to 7 servers, but firms in retail with 100 to 299 employees are likely to have only 1 to 3 servers.

Table 4 shows the number of firms for each industry that fit into the size ranges originally defined in Table 3. The purpose of Table 4 is to estimate the size of a market in terms of number of firms. For example, if the target market is firms in healthcare and retail with 10 servers, we would use the data in Table 3 to identify the appropriate employment size range for 10 servers, then find the number of firms that fit that profile in Table 4.

Table 5 is not meant to necessarily relate to the previous tables with regard to market sizing by number of servers, but is a summary of total number of firms by employment size. It provides a basic perspective on overall market size by number of employees.

The data in this report is a high-level overview of the market, but the approach can be used to identify much more specific markets.

Colocation and Server Hosting Markets: Ratio of PCs to Total Employees

There are literally hundreds of vertical markets based on SIC/NAICS codes. For this report we have consolidated them into eight basic verticals which loosely follow the SIC/NAICS primary classifications. Table 1 shows the ratio of PCs to total employees. This data will be used to calculate the number of PCs in each industry based on total employment data.

Table 1: Ratio of Deployed PCs to Total Employees

Data is read as 1 PC per nn employees.

Industry	PC to Total Employees
Education	1:0.79
Finance/Bank/Insurance	1:1.54
Government*	1:1.48
Healthcare	1:2.05
Manufacturing	1:2.59
NonProfit*	1:1.99
Retail	1:5.20
Services	1:2.28
Transportation	1:3.72
Utilities	1:2.04
Total	1:1.94

Source: Applied Computer Research, Inc.^{1,2}

*Table 1 includes data for government and non profit organizations. These vertical markets are not included in the following tables because they are not reported in the U.S. Census Bureau data.

The ratios in Table 1 were calculated based on data collected in the *Directory of Top Computer Executives* database.

Colocation and Server Hosting Markets: Overall Market Totals by Industry

Table 2 includes totals for each industry based on U.S. Census Bureau data. The number of PCs is calculated based on the ratio data in Table 1, then the number of servers is calculated using the 20 PCs per server average discussed earlier. The U.S. Census Bureau data includes only employer firm data and does not include firms without a payroll. U.S. Census Bureau data indicates there are over 30 million firms in the U.S., but there are only slightly more than six million firms with payroll. Those six million firms with payroll are reported here.

The U.S. Census Bureau is likely the most reliable source for estimating net market size by vertical market and employment size. However, about 1% of organizations are reported more than once based on their participation in multiple vertical markets. See page 7 for more detail on how this impacts the numbers in this report.

Table 2: Totals by Industry

Industry/NAICS	Number of Firms	Number of Employees	Number of PCs	Number of Servers
Education 61	77,102	3,039,385	3,847,323	192,366
Finance, Bank, Insurance 52	264,193	6,548,868	4,252,512	212,626
Healthcare 62	615,067	16,797,647	8,193,974	409,699
Manufacturing, Mining, Media Construction 11, 21, 23, 31-33, 51	1,205,829	24,860,360	9,598,595	479,930
Retail, Entertainment, Accommodations, Food Service 44-45, 71, 72	1,306,562	29,333,359	5,641,031	282,052
Services 42, 53, 54, 55, 56, 81	2,457,239	34,993,802	15,348,159	767,408
Transportation 48-49	174,265	4,395,432	1,181,568	59,078
Utilities 22	6,123	622,757	305,273	15,264
Totals	6,049,655	120,604,265	48,368,435	2,418,423

Source: Applied Computer Research, Inc.^{1,2}, U.S. Census Bureau³

There are some interesting characteristics in Table 2. First, the number of PCs and servers are not meant to represent the total being used in the market. There are a large number of firms with just a few employees and many of those will not have servers. Since the numbers are calculated based on total employment in the industry, they represent a way to compare the relative size from one vertical market to the next.

To be consistent, the data in Table 2 was created using the same approach for all vertical markets. However, the education market probably represents a wild card in the bunch. By the very nature of the education market there are commonly many more deployed PCs than there are employees in educational institutions. On the academic side computing is typically network intensive with student applications on the web, as opposed to applications that are hosted locally, requiring more servers and support. Therefore, there is reason to suspect the number of servers in education may be lower than the averages calculated here. More study is needed for this vertical market.

Another interesting characteristic is the total number of servers. Focusing on a vertical market with a large total number of servers can be deceiving without taking into consideration the total number of firms in that vertical.

Colocation and Server Hosting Markets: Number of Servers by Employment Size

The estimated number of servers in Table 3 is calculated based on the PC ratios reported in Table 1. For the companies with less than 20 employees a value of 0 or 1 server is an assumption, not calculated. For the other columns the number of servers value is a minimum number of servers based on the averages.

If your market focus is locating companies with 10 or more servers, the data shows what employment size ranges for each vertical is likely to be using 10 or more servers. For example, in the finance market the target is companies with 300+ employees whereas in the retail market the target would be companies with 1000+ employees.

Table 3: Estimated Number of Servers Based on Employment Size

Industry/NAICS	<20 Emps	20-49 Emps	50-99 Emps	100-299 Emps	300-499 Emps	500-999 Emp	1000+ Emps
Education ¹ 61	0-1	0-3	3-6	6-18	19-32	32-63	63+
Finance, Bank, Insurance 52	0-1	0-1	1-3	3-10	10-16	16-32	32+
Healthcare 62	0-1	0-1	1-2	2-7	7-12	12-24	24+
Manufacturing, Mining, Media Construction 11, 21, 23, 31-33, 51	0-1	0-1	0-2	2-6	6-10	10-19	19+
Retail, Entertainment, Accommodations, Food Service 44-45, 71, 72	0-1	0-1	0-1	1-3	3-5	5-10	10+
Services 42, 53, 54, 55, 56, 81	0-1	0-1	1-2	2-7	7-11	11-22	22+
Transportation 48-49	0-1	0-1	0-1	1-4	4-7	7-13	13+
Utilities 22	0-1	0-1	1-2	2-7	7-12	12-24	25+

Colocation and Server Hosting Markets: Total Number of Firms by Industry and Employment

The data in Table 4 shows the actual number of firms in each vertical for the various employment size ranges. This data can help establish an approximate overall market size based on the vertical markets and employee size data of interest in Table 3. Using the same example from the previous section, finance and retail firms with 10+ servers, there would be 717 finance firms with 300+ employees and 2814 retail firms with 1000+ employees, for a total market of 3531 firms.

It is also important to understand that the U.S. Census Bureau reports the total number of firms that fit into each vertical market category, however, some firms fit into more than one category. H-P for example is considered a manufacturing firm, but H-P is also in the services business and is therefore counted in both vertical market categories under its appropriate size column. This anomaly tends to occur most frequently for larger firms, but less frequently in the smaller size categories. Each cell, therefore, accurately represents the number of firms, but the aggregate for any individual column needs to be adapted for your individual needs. Again, only 1% of firms are subject to this anomaly and mostly in the larger employment sizes. Contact ACR for more information.

Table 4: Number of Firms by Industry and Employment Size

Industry/NAICS	<20 Emps	20-49 Emps	50-99 Emps	100-299 Emps	300-499 Emps	500-999 Emp	1000+ Emps
Education ¹ 61	59,580	9,220	3,995	2,657	485	531	634
Finance, Bank, Insurance 52	242,951	10,953	4,493	3,371	717	556	1,152
Healthcare 62	535,893	44,162	15,227	13,284	2,591	1,831	2,079
Manufacturing, Mining, Media Construction 11, 21, 23, 31-33, 51	1,049,404	93,222	32,419	20,358	3,703	2,765	3,958
Retail, Entertainment, Accommodations, Food Service 44-45, 71, 72	1,127,163	119,335	35,312	16,973	2,842	2,123	2,814
Services 42, 53, 54, 55, 56, 81	2,232,942	123,739	41,383	31,402	7,892	7,089	12,792
Transportation 48-49	153,087	11,412	3,922	2,949	686	682	1,527
Utilities 22	4,745	538	332	260	49	39	160
Totals	5,405,765	412,581	137,083	91,254	18,965	15,616	25,116

A Word About the U.S. Census Bureau Data

The data in Table 2, Table 4, and Table 5 has been calculated by ACR from the two U.S. Census Bureau Excel data tables referenced in the Sources section below. The summary industry classification scheme and employment size ranges were designed by ACR and the data adapted to fit the design.

The U.S. Census Bureau data is primarily compiled from Internal Revenue Service and Social Security Administration, with additional data from U.S. Census Bureau research data. The data excludes nonemployer businesses, private households, railroads, agriculture production, and most government entities. Contact Alan Howard at Applied Computer Research, Inc. for more information.

Colocation and Server Hosting Markets: Total Number of Firms by Employment Size Only

As a point of interest and to add perspective to the total size of the U.S. marketplace, Table 5 shows U.S. Census Bureau data for the number of employer firms based on employment size. Although this final table does not directly relate to the previous data tables in terms of markets by number of servers, it is certainly useful for those companies that base their market targeting on organization size alone. It is particularly useful as a basis for comparison when sourcing data for marketing related activities.

Table 5: Number of Firms by Employment Size

Number of Employees	Number of Firms
Total	6049655
0-4	3705275
5-9	1060250
10-14	425914
15-19	218928
20-24	134254
25-29	89643
30-34	64753
35-39	47641
40-44	38331
45-49	29705

50-74	86364
75-99	41810
100-149	39316
150-199	18620
200-299	17780
300-399	8155
400-499	4715
500-749	6094
750-999	2970
1000-1499	2916
1500-1999	1542

Additional Available Data for the Data Center Market

The medium and large end-user data center market is not specifically addressed in this report. Number of firms based on employment is interesting data, but does not define where to find end-user operated data centers. Additional data and information is available for those colocation and server hosting companies that are pursuing medium or larger data center operators in ACR's report *Defining the Data Center Market and Data Center Market Size*, available at www.itmarketintelligence.com/mo-reports.htm.

ACR is also in the process of developing a method for estimating the square foot size of end-user managed data centers based on similar approaches used in this report. Any input on this subject will be appreciated.

Colocation and Server Hosting Markets: Final Thoughts

This report covers some basic information on defining and sizing U.S. markets. There are many options for more clearly defining, identifying, and targeting specific markets on a case by case basis. Committing to use a more strategic approach to market definition and targeting should translate to more productive market coverage and penetration.
